

 *agent*: $\omega_m^{t,a\text{-positive}}$ (an example in the classic traffic assignment scenario)

My current strategy is [0.191, 0.287, 0.408, 0.114]. Today's costs: Route 1: 3880.1 (worse than yesterday's 3689.7). Route 2: 3679.7 (second best). Route 3: 3657.7 (best today). Route 4: 3902.1.

Comparing with previous days: Route 3 is again the best, improving from 3701.0 yesterday. Route 2 is second best, also improved from 3785.3 yesterday. Routes 1 and 4 performed poorly today after yesterday's improvements, showing volatility. Route 3 showed the best performance today and improved, so it deserves reinforcement. Route 2 also improved significantly, so I'll reinforce it as well to keep exploring both top options.
